SUMMARY OF QUALIFICATIONS

Professional Summary: Computer Engineering student with experience in C programming, UNIX-style systems, and debugging in simulated hardware environments. Skilled at investigating issues, reading and modifying reference code, and collaborating across teams. Strong communicator and effective team player.

Programming Languages: C++, C, Python, Assembly, SQL, JavaScript, HTML, CSS, TypeScript, Java, PHP, Bash

Tools/Frameworks: Windows, UNIX/Linux, GIT, GDB, GCC, FPGA, Excel, Microsoft Power BI

Technical Competencies: Testing & Debugging, Automation, Scripting, Technical Communication, SDLC

EDUCATION

University of Toronto

Toronto, ON

Bachelor of Applied Science in Computer Engineering  Sep 2022 – Exp. May 2027 | Completed 3rd year

Relevant Courses: Operating Systems, Object Oriented Programming, Data Structures and Algorithms, Software Communication and Design, Computer Networks, Computer Organizations

Relevant Course GPA: 3.5

WORK EXPERIENCE

Evertz Microsystem Ltd.

Burlington, ON

Embedded Systems Design Engineer

 Sept 2025–Aug 2026

- Developed production-ready Linux-based embedded C++ software that integrates existing hardware and FPGA with a custom frontend webpage and CLI to monitor, process, configure, and control system functionality.
- Diagnosed and resolved complex software and hardware integration bugs across various products using C++, Python, PHP, and Bash through manual and automated testing.
- Collaborated with hardware, FPGA, and software-testing engineers to design, integrate and validate new product functionality ensuring technical requirements were met, without introducing regression-based issues.

Lactalis

Toronto, ON

Supply Chain Data Analyst

 May 2023 – Aug 2023

- Automated daily report generation, reducing manual effort and production time by 75% using custom Python scripts to streamline Excel-based workflows.
- Delivered daily presentations to supply chain analysts and plant leads to share insights from automated reports and support data-driven decision making across operations.

PROJECTS

Operating System Development with OS/161

 Jan 2025 – Apr 2025

- Implemented core UNIX OS components in C within a MIPS simulator, including virtual memory management, syscall handling, and page allocation, validated through 30+ robust kernel-level test cases.
- Created locks and semaphores to enable safe multi-threaded execution in kernel space, with direct experience in system call integration and low-level memory management.

Schedules and Course Tracker | [GitHub](#)

 Dec 2024 – Jan 2025

- Created an interactive frontend using JavaScript, HTML, and CSS, streamlining access to shared notes and schedules, reducing manual search time by 55%.
- Built a Python-based Flask backend with MySQL to manage course-specific notes and schedules for 13 users, enabling secure storage, organized retrieval, and data consistency.
